

Deicer Offseason Best Practices

Regular Usage

As with any motor vehicle, problems may arise if the Tempest is left unused for long periods. We recommend running each unit for 25 minutes every three weeks (minimum). During these maintenance runs, it is important to engage all primary functions of the unit, including the following:

- Driving the unit
- Raising the boom & jib, and extending the boom
- Rotating the boom
- Running the fluid heater
- Briefly spraying all fluid types, including forced air

Fluid Tanks

JBT recommends that fluid tanks of the Tempest should remain near to full when the unit is not in service. The tanks are appropriate for long-term storage of deice and anti-ice fluid. Check with fluid manufacturers for recommended storage tank cleaning intervals.

Storage

Ideally, units are stored at an indoor storage or maintenance facility. As this is often not possible, we recommend protecting enclosed cab units with our custom cab weather cover. This keeps ice and snow off the cab during winter and prevents UV damage from the sun in the summer.

Deicing Season Preparation

In preparation for the start of deicer season, it is important to check the complete functionality of your fleet. To ready your units, JBT can provide maintenance kits, including the following:

- Complete filter kits for every unit configuration
- Hardi Pump seal kits
- Nozzle gauge replacements
- Fluid heater service kits
- Worm gear service kits
